

$$m \geq 2 \text{ et } p \geq 2$$

$$f = p^m + 1$$

$$\exists k, q \in \mathbb{Z}, m = k(2q+1) \Rightarrow f = p^{k(2q+1)} + 1$$

$$\Rightarrow \text{on pose } a = p^k, \text{ donc } f = a^{(2q+1)} + 1 \Rightarrow f = a^{(2q+1)} + 1^{(2q+1)}$$

D'après le 1)

$$f = a^{(2q+1)} + 1^{(2q+1)} = (a+1) \times \sum_{k=0}^{2q} (-1)^k a^k + 1^{2q-k}$$
$$= (a+1) + \sum_{k=0}^{2q} (-1)^k (a)^k$$

$$a+1 = p^{k+1} > 1 \quad \text{et} \quad \sum_{k=0}^{2q} (-1)^k (a)^k > 1 \quad \text{aussi.}$$
